HLB HAMT ADVANCED ANALYTICS

HLB HAMT: Advanced Analytics Services in UAE That Turn Data Into Foresight

We deliver advanced analytics services in UAE that connect the data you already hold, model what comes next and hand forecasts to the people who decide. For organisations across the Emirates and the wider GCC, that work comes from a firm that also audits and advises on the numbers.

Button: [Book a free consultation](#) → #contact

Button: [Explore our services](#) → #services

One data foundation. Three ways to put it to work.

Every model and every report we deliver draws on the same reconciled data.

Data transformation

Clean, integrate and transform data from every source into one analytics-ready foundation, refreshed on schedule.

Statistical modelling

Predict, forecast and segment using machine learning and time-series methods trained on your own history.

Enterprise reporting

Dashboards, scorecards and scheduled delivery that put results in front of every decision maker.

We size the build to your data, from one model on your current sources to a full enterprise data platform.

S2 · DARK STATS STRIP (4 ITEMS, NO HEADING ON PAGE)

11 services across data transformation, statistical modelling and enterprise reporting.	85%¹ of UAE CEOs surveyed say their organisation's culture enables AI adoption.	Audit-grade Models and forecasts from a licensed audit, tax and advisory firm.	In-region Scoped and built by our Dubai consultants, in your time zone.

WHY HLB HMT

Forward-Looking Analytics, Grounded in How the Numbers Are Made

HLB HMT is an advanced analytics company in UAE that is also a licensed audit, tax and advisory firm and a member of the HLB network. Our accountants know how a revenue line or cash position is produced; our engineers know how to move, model and test the data behind it. Both disciplines sit inside our [digital transformation and analytics services](#).

What we do

One team owns the whole path. We build the pipelines and warehouse, design the data models, train the machine learning, forecasting and segmentation models, and then publish the dashboards and scheduled reports your people open every week. Nothing is handed between suppliers.

Who we work with

We work with finance, operations, commercial and data leaders in organisations across the Emirates and the wider GCC. Some bring one pressing question the board wants answered. Others need a data platform that will carry every forecast and report to come.

How we deliver

We begin by assessing data readiness and recommending where to start. A smaller initiative can connect to the sources you already run; an enterprise-scale programme justifies a dedicated data platform. Every engagement then follows our [five-stage method](#), and each stage ends with something you can review.

Support once models are live

Models drift as markets move, so we can stay involved after launch. We monitor pipelines and data quality, measure predictions against actual results and retrain when accuracy slips. Regular reviews with you decide what to adjust, and we coach your analysts to take on more.

S5 · CAPABILITIES (3 ROWS AND FOUNDATION LAYER) · #EXPLOREANALYTICS

CAPABILITIES

Three Questions We Help Your Data Answer

We treat reporting as the starting line. A standard report tells you what happened; our analytics team takes the same data further, to explain why it happened, estimate what comes next and show where to act. Each row below covers one of those questions and the methods behind it.

CAPABILITY

Why the numbers moved

We run regression and correlation analysis on the transactions and ledger lines that sit behind a KPI movement. Instead of a flat month-on-month variance, you see which products, regions or customer groups drove the change, and by how much.

KEY CAPABILITIES

- Relationship and trend analysis
- Drivers behind KPI movements
- Segment-level comparisons
- Drill-down from summary to detail

CAPABILITY**What happens next**

We build machine learning and time-series models on your historical data to estimate outcomes for the weeks and quarters ahead. Seasonality, trend and one-off events are handled separately, and forecasts can show a likely range as well as a single figure.

KEY CAPABILITIES

- Machine learning models
- Time-series forecasting
- Predictive scoring
- Scenario comparison
- Model testing against history

CAPABILITY**What to do about it**

We turn model outputs into a short list of actions: which segments and cohorts to target, which accounts need attention first. Predictions appear inside the dashboards and scheduled reports your teams already use, so they shape decisions rather than sitting in a separate file.

KEY CAPABILITIES

- Customer and audience segmentation
- High-value cohort identification
- Predictions inside dashboards
- Scheduled delivery to decision makers
- Prioritised action lists

FOUNDATION LAYER**The data foundation underneath**

We build the layer every model depends on, and we build it first. Automated pipelines feed a central warehouse or layered lakehouse, where data is refined from Bronze (raw) to Silver (cleaned) to Gold (business-ready), then modelled into star schemas. The reason is practical: only 16% of GCC CEOs surveyed agree their most-used AI tools have access to all the relevant documents and data.³

KEY CAPABILITIES

- Automated ETL pipelines
- Warehouse and data marts
- Bronze, Silver and Gold layers
- Star-schema data models

S6 · USE CASES (6 FLIP CARDS: FRONT = TITLE AND TAGLINE, BACK = DETAIL; NO BUTTONS) ·
#USECASES

USE CASES

Where Our Models Earn Their Keep

We start from the decision a model has to support, then work back to the data it needs, as in these six examples.

Cash flow forecasting

Next quarter's cash position, visible in time to plan

We forecast inflows and outflows for the coming quarters from receivables, payables and payment history. Our accountants review the logic alongside the engineers, so the forecast ties back to your financial statements.

Demand and inventory planning

Stock and purchasing set by estimated demand, not habit

Our models estimate demand by product, location and period, so stock, purchasing and the working capital tied up in inventory are planned in advance. Planners see a shortfall or overstock building early.

Customer churn prediction

Spot likely leavers while you can still act

Signals such as falling order frequency, shrinking spend or rising complaints drive our churn score for each customer. Account teams get a ranked list and step in before the relationship lapses.

Lead conversion scoring

Sales time spent on the likeliest buyers

We rank open leads by likelihood to convert, based on the profile and behaviour of past conversions. Scores can flow into HLB HAMT's own [SugarAI CRM](#), so sales teams see them in the pipeline.

Customer and audience segmentation

Customer groups defined by how people actually buy

Our clustering models group customers by what they buy, how often and how much they spend, so marketing and sales can target, retain or upsell each segment on its own terms.

Executive scorecards and automated reporting

Board packs and scorecards that arrive on schedule

We build interactive dashboards and scorecards with a custom view per audience, and set reports to go out automatically. Our [data visualisation services](#) cover the design side in more depth.

SECTORS HLB HAMT SERVES

Financial Services · Real Estate and Construction · Healthcare · Hospitality & Leisure ·
Manufacturing · Transportation & Logistics · Consumer / Retail · Government & Public Sector ·
Energy · Technology, Media & Telecommunications

WHAT WE DO

HLB HMT's Advanced Analytics Services

We run data analytics and automation as one service line, from the first extract of source data to the report that reaches the boardroom. The six services below can be taken singly or together.

01 · Data transformation

Data integration and ETL pipelines

We extract data from your ERP and accounting systems, CRMs, spreadsheets, APIs and flat files, then clean, standardise and reshape it. Scheduled pipelines load it into one place and flag any run that fails, so month-end figures no longer depend on someone re-keying numbers by hand.

02 · Data transformation

Warehousing, data marts and migration

We design a central warehouse with subject-area data marts, so each team queries a focused, consistent set of tables. Where data sits in legacy stores, we migrate it with reconciliation checks. When volume and variety grow, we extend the design into a layered lakehouse.

03 · Data transformation

Analytics-ready data models and self-service preparation

Star schemas built around the KPIs you already report on keep queries fast and give every measure one agreed definition. Alongside them, we set up self-service data preparation, letting analysts combine and shape approved data for their own questions without waiting on IT.

04 · Statistical modelling

Machine learning and predictive analytics

We train models on your historical patterns, choose the approach that performs best on data held back for testing, and check results against past outcomes before anything goes live. Predictions then appear inside the reports your people already use, next to the actuals they will be judged against.

05 · Statistical modelling

Time-series forecasting and segmentation

We forecast revenue, cash and demand week by week or quarter by quarter, allowing for regional calendar effects such as Ramadan, Eid and the summer slowdown. Customer segments, grouped by behaviour and value, are refreshed as new transactions arrive, so targeting does not run on stale groups.

06 · Enterprise reporting

Enterprise reporting and automated delivery

Our team designs interactive dashboards and scorecards for each audience, with access set by role so people see only what they should. Reports go out on a schedule you choose, and custom data views plus self-service analytics let managers answer follow-up questions without requesting a new report.

S8 · MID-PAGE CTA A · CTA 2

Find the Right Starting Point for Your Data

We review your sources, data quality and goals, then recommend where to begin and what the first model should answer.

Button: [Request a readiness assessment](#) → [#contact](#)

S9 · DELIVERY METHOD (HIGHLIGHTED BAND #005A77; NO BUTTON) · #METHODOLOGY

HOW WE DELIVER

Five Stages From First Workshop to Live Forecast

We run every engagement through the same five stages. Each stage has an agreed owner and deliverable, and nothing moves on until your team approves the one before.

Step 1

Discover and assess

We interview stakeholders, pin down the decision to improve, audit your sources and data quality, and agree measurable success criteria.

Step 2

Engineer the foundation

Automated pipelines bring your sources together in a warehouse or lakehouse, and star schemas fix how each KPI is calculated.

Step 3

Build and validate models

We develop forecasting, machine learning and segmentation models, then test them against unseen periods before your team signs them off.

Step 4

Deploy into daily reporting

Predictions go live inside your dashboards, scorecards and scheduled reports, and your team is trained to read and act on them.

Step 5

Track performance and retrain

We compare forecasts with actuals, check each data load for gaps, retrain when patterns shift and agree changes with each model's owner.

S10 · ENGAGEMENT MODELS (3 TABS; NO FEATURED CARD, NO BUTTON) · #PACKAGES

ENGAGEMENT MODELS

Start Where Your Data Is, Then Scale

We package our advanced analytics services in three ways, matched to how ready your data is. You can take them in order or begin at whichever point fits your situation.

TAB 1: ASSESS

Know what your data can support before you commit budget.

Data readiness assessment

A review of your sources, data quality, skills and goals, ending in a recommended starting point and roadmap.

Use-case prioritisation

We weigh forecasts and segments by value and feasibility, so the first build is the one likeliest to pay back.

TAB 2: BUILD

One focused model first, or a full platform from the outset.

Proof of value

One model on one business question, built on your existing sources to test the return before any wider investment.

Enterprise data platform

Pipelines, a warehouse or lakehouse, governed data models and reporting, delivered in phases across departments.

TAB 3: EXTEND

Keep models accurate and your team self-sufficient after go-live.

Post-launch model care

A named consultant watches pipelines, data quality and model drift, retrains as needed and runs periodic reviews with you.

Forecasts added to current reporting

Model outputs placed in the dashboards and scorecards you already run, without rebuilding them.

Self-service enablement

Hands-on training and self-service data preparation, so your analysts can build new views themselves.

S11 · HLB HAMT ADVANTAGE (6-TILE CREDENTIAL GRID)

HLB HAMT ADVANTAGE

Why UAE Businesses Choose HLB HAMT for Advanced Analytics Services

HLB HAMT pairs an audit firm's discipline with in-house engineering, and that pairing shows up in six ways.

Forecasts finance will sign off

Models are shaped with our accountants, so forecasts reconcile to the ledger you close each month.

Data analytics and automation, one team

The people who build your pipelines also build the models and the automated reports.

One firm for the follow-through

When a model raises a tax, risk or process question, our own specialists pick it up.

Personal data handled with care

Models that use customer data are designed with input from our data privacy specialists.

Analytics and Power BI from one partner

Pair forecasting with our [Power BI services](#) so predictions and reports share one model.

Built on your existing systems

We work with the databases, ERPs, CRMs and files you already run, with no rip-and-replace.

COMMON QUESTIONS

Common Questions About Advanced Analytics Services in UAE

What is the difference between basic reporting and advanced analytics?

A report describes the past: sales last quarter, stock on hand, staff costs. Advanced analytics uses statistical modelling, machine learning and predictive techniques to explain the cause behind a result, estimate the likely next outcome and suggest a response. HLB HAMT builds both on one data foundation, so explanation and forecast start from the same reconciled figures.

What is ETL, and why does our business need it?

ETL stands for extract, transform, load: copy records out of systems such as your ERP, CRM, spreadsheets and APIs; fix formats, remove duplicates and apply business rules; then write the result into a warehouse or data lake. Without it, each department keeps its own version of the numbers. We turn those three steps into pipelines that start at set times, replacing manual file copying.

What is a star schema, and why does it matter for performance?

A star schema puts a fact table of transactions or events at the centre and links it to dimension tables that describe them, such as customers, products and dates. Reporting tools read this shape more efficiently than one wide, flat table, so pages load faster and totals stay consistent. We design star schemas around your KPIs using dimensional modelling.

How does predictive analytics work in practice?

A predictive model studies historical data to learn which patterns came before a given outcome, then scores new data to estimate how likely that outcome is now. We test every model against periods it has not seen before anyone relies on it, then place the predictions inside the reports your teams already open. The [use cases above](#) show typical applications.

Can you work with our existing data infrastructure?

Yes. We connect to on-premises databases, ERP and accounting systems, CRMs, cloud data warehouses, REST APIs and flat files, and we build on what you have already paid for rather than asking you to replace it. Where a source is hard to reach, we agree a workable extract with your IT team before any build starts.

What is customer segmentation, and how does it drive revenue?

Segmentation divides your customer base into groups that behave alike, whether by spending, product mix, channel or demographics. Each group can then get offers, service levels and sales attention that suit it, which supports retention and sharpens cross-selling. We run machine learning clustering across many customer attributes, then profile each cluster so your team knows who is in it and what it is worth.

Do we need a data warehouse or data lake to get started?

Not always. A focused initiative can often read directly from the sources you already run, which keeps the first project light. Larger programmes that draw on many systems are better served by a data lakehouse, which blends a lake's flexibility with a warehouse's structure; we lay it out in the layers described above. A [readiness assessment](#) tells you which route fits before you commit.

How do you protect personal data used in analytics models?

We limit each model to the personal data it needs and have our [data protection advisory](#) team review the design. That matters because churn, segmentation and lead-scoring models often draw on

personal data, and in the UAE its processing is governed by the Personal Data Protection Law, Federal Decree-Law No. 45 of 2021.⁴ We work in line with that law from the first design session.

How does advanced analytics relate to data visualisation and Power BI?

They are three parts of one chain. Advanced analytics produces the forecasts, drivers and segments; data visualisation decides how people see them; Power BI reporting is where many teams use them day to day. HLB HAMT delivers all three, and many clients start with reporting and add prediction once their data foundation is in place.
